NEW RESIDENCE HALL FACILITY STUDY & BUILDING STANDARDS DEVELOPMENT FOR

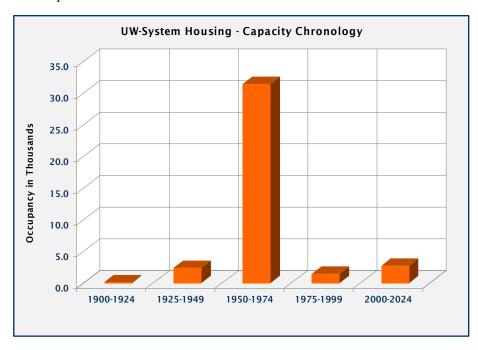

The University of Wisconsin Residence Halls

DFD # 12A3G

August 29th, 2012

Background and Purpose

The purpose of this study is to provide a comprehensive database of information and a set of recommendations for UW System and individual universities to use to help accurately plan for the type, size, cost and schedule for additional housing in response to student needs as approved by the Board of Regents. It is not the intent to this study to mandate a "one size fits all" residence hall plan configuration or procurement process for UW Campuses.

The majority (85%) of the current housing stock on University of Wisconsin four-year campuses is over 45 years old. Due to projected growth at several campus combined with a shortage of housing to adequately accommodate all freshman and sophomores as required by the UW System Board of Regents, there is a substantial need System-wide to quickly bring new residences halls on line.

Several campuses have looked to private developers to quickly construct residence halls. Reasons for this include:

- 1. Lack of available land either on campus or nearby for purchase; purchase costs may also be high, funding may not be available, and timeframes for approvals can be long.
- 2. The timing of the biennial budget cycle may not be aligned with the timing of need for beds, and the many steps required in the capital budget cycle and project implementation create delays in meeting needs.

This study will include information on non-traditionally delivered projects to provide Campuses information about how these types of delivery methods compare to "traditional" delivery methods, including cost and quality differences.

Project Description

This study is based on factual evaluation of:

- 1. Current Division of Facilities Development Master Specifications/Design Guidelines along with a broad range of potential alternatives as well as common upgrades requested by user groups to accommodate market conditions and improve operations, and
- 2. Design components and construction costs of recently-completed state, not-for-profit, and private residence halls in Wisconsin.

To facilitate informed planning and decision-making by agency representatives, this study addresses current trends in student housing, first cost versus long term durability/energy use, and project duration/schedules as related to a broad range of variables including construction delivery method, structural systems, MEP systems, construction details and specifications, materials and finishes, etc.

The process for this study involved representatives from DFD, UW, and the A/E working in a team format to refine an initial work plan and schedule. A/E then organized and facilitated workshops with the study leaders. A/E recorded decisions made in a summary document.

Audience: The audience for this document is Campus Housing Management, UW-System Administration Planners, Division of Facilities Development Architects & Engineers and selected A/E teams on future residence halls.

Scope

The scope of this study includes three distinct components:

<u>Part 1</u>: Compile information and statistics in a consistent format on all halls built in the past seven years for either the UW System four-year campuses or associated off line Foundation built process.

<u>Part 2</u>: Perform a comparison of cost/schedule/construction & MEP systems of a select cross section of residence halls as identified by the Study Leaders. Halls selected for inclusion were:

- a. UWSA, Design/Build UW Platteville Southwest Hall (382 beds) 2006
- b. UWSA/DFD UW-La Crosse Reuter Hall (382 beds) 2006
- c. UWSA/DFD UW-Madison Ogg Hall (622 Beds) 2007
- d. Viterbo University Clare Apartments (118 beds) 2012
- e. UW-Platteville Real Estate Foundation Rountree Commons (600 beds) 2012

Part 3: Develop a "Specification Checklist" organized in CSI Masterformat, for all building systems, with identification of those systems acceptable to both Division of Facilities Development and the UWSA Capital Planning & Budget office, as well as other alternatives, with cautions and concerns identified for systems that are not endorsed by UWS/DFD. Interactive sessions were conducted with DFD and UWSA professional staff to review existing DFD building guidelines and identify reasons for recommending use of systems identified in guidelines, and provide reasons for concern about systems that do not comply with guidelines. The report format includes a simplified spreadsheet where for each

component a "Basic Code Compliant", "Medium Quality", "Recommended Quality", and "Enhanced Option" are identified. "Recommended Quality" is the level of quality that is consistent with DFD Guidelines, based on DFD/UWSA/AE discussion during workshops. Commentary related to first-cost and total cost of ownership is identified where relevant.

Report Components:

Report Components are available in electronic formats that are automated where practical, updatable, printable, and useable by those entities planning future residence halls.

Residence Hall Study Summary Document

Executive Summary -- Introduction, Background, Synthesis, and Conclusions Related to Recommended Parameters for Future Residence Halls

Section 1: Data Summary

- a. Identification of the Campus and Hall
- b. Description of housing configuration (i.e. traditional, suite, apartment, etc)
- c. Number of beds
- d. Number of stories
- e. Number of parking stalls (bike, moped and vehicular)
- f. Description of non-residential uses developed in a tabular format by floor, and description of use (e.g. food service, central housing offices, etc.).
- g. Description of major building systems (i.e. roof and envelope, structural, MEP, interiors, etc.)
- h. Basic site and building plans
- i. Cost breakdown: Information on soft costs, including A/E fees, DFD fees, Developer fees, borrowing costs, and furnishings, fixtures and equipment (FF&E). Use DOA Form 4265 to illustrate costs for General Construction, Mechanical, Electrical, Fire Protection, and Plumbing costs. Break out of size of major non-housing functions, i.e. food service, large meeting spaces, office space, etc. List utility types, Sustainable Design attributes, any unusual project conditions or challenges.
- j. Square footage breakdown total GSF, GSF/ASF per bed, ASF per unit, ASF of lounge spaces, SF of non-housing functions, area of overall building footprint, area of directly associated site, area of parking (structured and surface)
- k. Project schedule including month and year of RFP or enumeration, approvals, AE selection, bidding or CMAR selection or negotiation, construction.

Section 2: Planning Document

- a. Space Planning commentary indicating commentary on typical arrangements illustrated in 5 representative projects
 - i. Square footages and plan diagrams of representative typical dwelling unit arrangements like suites and doubles.
 - ii. Square footages and plan diagrams of floor plan arrangements of typical arrangements illustrated in 5 representative projects for units, lounges, and circulation, and their associated efficiencies
- b. Construction and MEP Systems Planning
 - i. Matrix comparing components meeting DFD guidelines, life spans, efficiencies and costs to other construction standards, life spans, efficiencies and costs. Costs are illustrated as cost per square foot, with escalation factor to today's construction costs and scheduling factors.
- c. Schedule Planning
 - i. Matrix comparing typical State of Wisconsin project schedule to Design Build and Foundation built schedules.

Section 3: Project Construction System and MEP System Component Planning Checklist

a. "Specification Checklist" organized in CSI Masterformat

Executive Summary

<u>Introduction</u>

The purpose of this study is to provide a comprehensive database of information and a set of recommendations for UW System and individual universities to use to help accurately plan for the type, size, cost and schedule for additional housing in response to student needs as approved by the Board of Regents. It is not the intent to this study to mandate a "one size fits all" residence hall plan configuration or procurement process for UW Campuses.

Background

The majority of the current housing stock on University of Wisconsin four-year campuses is over 45 years old. Due to projected growth at several campus combined with a shortage of housing to adequately accommodate all freshman and sophomores as required by the UW System Board of Regents, there is a substantial need System-wide to quickly bring new residences halls on line.

Several campuses have looked to private developers due to a perception that this is a faster way to construct new residence halls. This study provides timeline information for several representative projects which shows that project timeline opportunities for both Foundation led and DFD led projects can be similar when using certain implementation practices.

Synthesis

Data has been compiled and formatted to illustrate, in a consistent manner, the scope, cost, and schedule for 17 Residence Halls constructed in the past 7 years to house students attending UW Campuses, plus one project at a private university. The project team has analyzed this data to identify commonalities, anomalies, successes and challenges

Conclusions

- 1. There is no "one size fits all" solution to providing student housing at UW Campuses
- 2. There is great value in using this compiled data for initial general planning, and subsequent analysis of proposed designs created for Campuses.
- 3. While it is tempting to build project budgets around the lowest first cost of systems, experience has shown that investment in higher quality/higher efficiency critical items like superstructure, envelope, and MEP systems is a more efficient use of funds long term.
- 4. Sustainable Design is a topic that requires a great degree of discussion in conjunction with early project definition. DFD Sustainability guidelines are similar to LEED parameters, but not identical. If campuses are interested in renewable energy resources like domestic solar, photovoltaics, or geothermal, the first cost and payback of these systems should be thoroughly analyzed. It has been shown on previous projects that these systems have a very long payback in the Wisconsin climate, especially for residence halls that have little use during the summer months.

- 5. Project costs should be analyzed on a cost per bed and cost per unit basis in addition to traditional metrics such as cost per square foot and building efficiency. It is possible to have a low cost per square foot but a high cost per bed if a building design is not providing efficiently sized housing units and support space.
- 6. Selection of construction systems and MEP systems has the largest impact on overall project first cost and life cycle cost. The second major factor affecting project first cost, cost per bed and energy consumption, is the amount of program space provided in addition to bedroom space. This includes the size of common living space within units, the size of common space on resident floors, and the size of common space for building-wide use. This is an observation, not a condemnation of the provision of this type of space, which is necessary for building community, but on a tight budget project campuses should place a higher priority on providing sleeping, toileting, and study spaces. The third major factor affecting project cost and cost per bed is the inclusion of non-program space like full basements, parking, district food service venues, and/or office space. This study recognizes that for analysis purposes these types of elements need to be culled out, so the cost and efficiency of a project can also be viewed for just the housing portion.

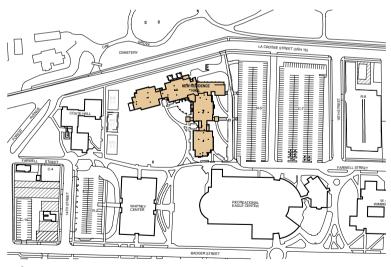

Section 1: Data Summary

This section contains data on 17 Residence Halls completed in the past +/-7 years to house students attending UW Campuses. Data is formatted identically for each project, including scale, definition of spaces, definition of schedule, and cost for ease of cross comparison. Projects analyzed were delivered via the traditional DFD process, design/build turn key process, Foundation led process, and a private independent project. The projects are organized alphabetically by campus. The spreadsheets provided in this report are available as live electronic documents from UW System for use by UW System and User Agencies for planning purposes.

- 1. UW La Crosse Eagle Hall, 08B3M
- 2. UW La Crosse Reuter Hall, 02G3H
- 3. UW Madison Lakeshore Residence Hall Phase I, 04D11
- 4. UW Madison Lakeshore Residence Hall Phase II, 10G3D
- 5. UW Madison Ogg Hall, 04D1I
- 6. UW Madison Smith Hall, turn key
- 7. UW Milwaukee Cambridge Commons, Real Estate Foundation led project
- 8. UW Milwaukee Riverview Residence Hall, Real Estate Foundation led project
- 9. UW Oshkosh New Residence Hall, 08K3J
- 10. UW Parkside Pike River Suites, 06K1G
- 11. UW Platteville Southwest Residence Hall, turn key
- 12. UW Platteville Rountree Commons, Real Estate Foundation led project
- 13. UW River Falls, South Forks Suites Addition, 09D2H, 99K4N
- 14. UW Stevens Point Residence Hall, 09D2H
- 15. UW Stout Red Cedar Hall, 02H2J
- 16. UW Whitewater Residence Hall, 06C1Q
- 17. Viterbo University Clare Apartments
- 18. Executive Data Summary of all of the residence halls listed above

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 2.7%; Basement Alt/Storage, 8.7%; Circulation, 18.3%; Mechanical, 4.8%; Resident Suites, 40.4%; Special Amenity, 3.6%; Lounges, 10.8%; Unassigned/other, 10.7%

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

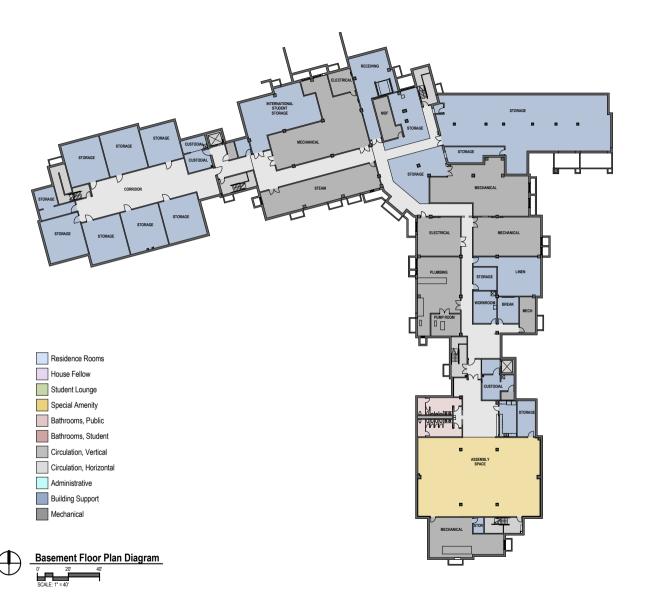

The building superstructure consists of concrete topped 8 inch precast plank bearing on 8 inch CMU. Basement walls are 16 inch cast in place concrete while the foundations are conventional spread footings. The first and second floor framing above the central zone is structural steel tranSFer beams supported by steel wide flange columns. Likewise, the first floor framing in the south wing is supported by steel tranSFer beams, plate girders, and steel wide flange columns.. CIVIL: Civil work included demolition, grading, erosion control concrete paving, sand volleyball court, dumpster enclosure, traditional and mountable curb and gutter, bike parking, sanitary, water, storm sewer, steam and chilled water. Stormwater management was achieved through five biofiltration basins around the project.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Building is heated and cooled using campus steam and chilled water. Two energy recovery units provide ventilation and exhaust for the building with operable windows to provide ventilation to the resident rooms. Two air hanlding units serve the main floor office spaces and a gather space in the basement. Four pipe fan coils are provided for each resident room. Building is fully sprinkled except 2-hr rated electrical room. Steam is used for heating domestic water. Building has a duplex water softener for treating domestic hot water. Building is served from 4160 V campus loop with a 1200 A main panel. Emergency power is provided by a 200 kW generator.

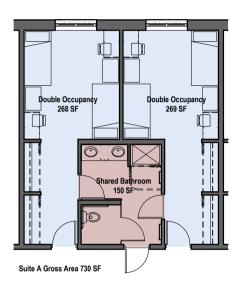

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

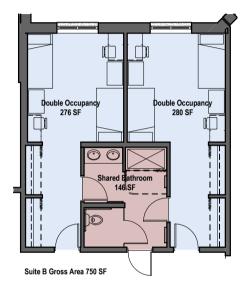

100 hp fire pump, backup gas fired water heaters, 2 computer room units. Technology systems include voice, data and cable television. One telecom room is ocated on basement level and four telecom rooms are located on floors first, second, third, fourth and fifth floors,

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 0.7%; Basement Alt/Storage, 11.1%; Circulation, 14.9%; Mechanical, 5.2%; Resident Suites, 51.2%; Special Amenity, 1.0%; Lounges, 1.0%; Unassigned/other, 14.9%: 77 Exterior parking stalls including 4 accessible ones

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

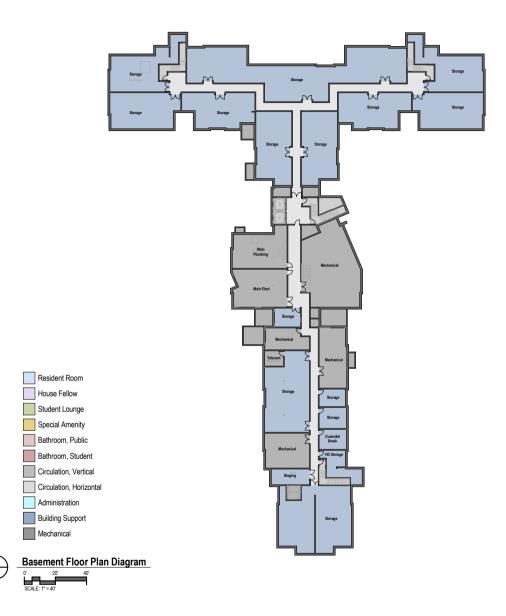

Abatement and demolition of existing 38,560 SF concrete frame, brick clad residence hall. Concrete footings & foundations. CMU bearing (ext/int) bearing walls. Precast concrete plank floor & roof structure. Architectural precast and face brick veneer exterior. Operable sash aluminum frame insulated windows. Ballasted single-ply EPDM roof over tapered insulation. CIVIL: CiVII work included demolition, grading, retaining walls, erosion control concrete paving, asphalt paving, traditional curb and gutter, sanitary, water, storm sewer. Stormwater management for the south portion of the project was achieved through a biofiltration basin that serves multiple campus facilities. Stormwater from north portion of the project discharged to municipal storm sewer. Sanitary and water services were provided from adjacent public right of way.

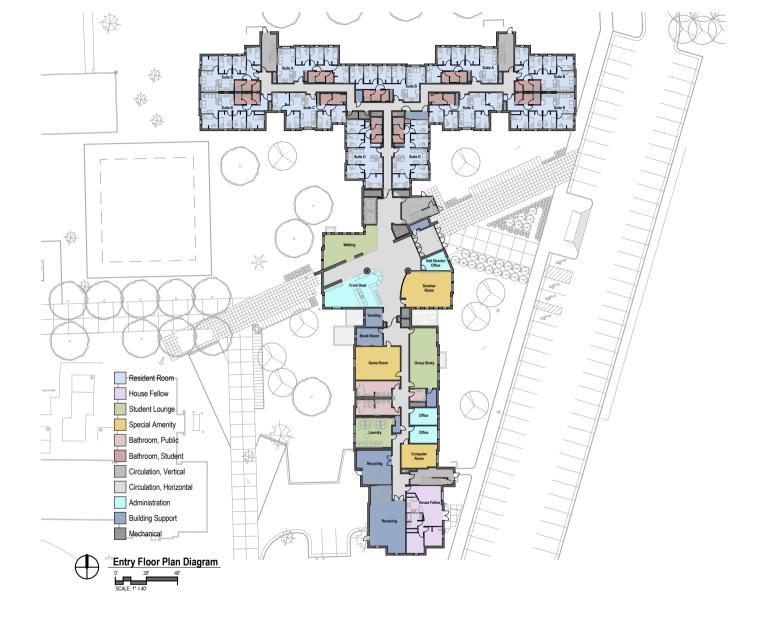

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

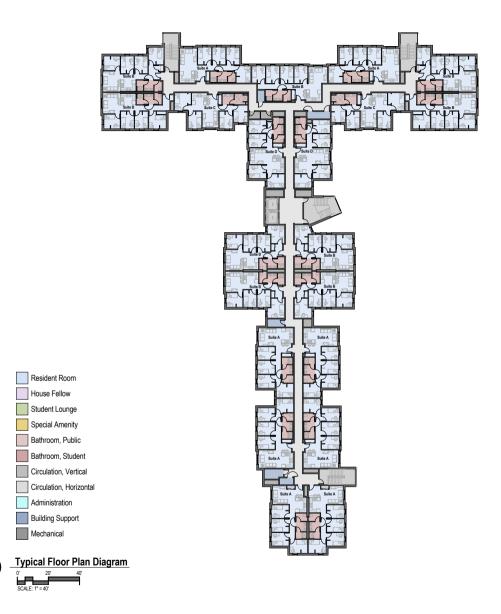

One four-pipe fanc oil per unit with ventilation ducted to return of unit. Energy recovery wheel system for exhaust & make-up air provides make-up air & exhaust for all units. Energy recovery unit has Campus steam and chilled water for pre-treating make-up air stream. VAV system serves conditioned common spaces on First Floor. VAV system is equipped with steam pre-heat coil, chilled water cooling coil, return fan, air-flow measuring stations and economizer cycle. Plumbing system included a booster pump, water softeners, and 2 steam water heaters. Building is served by 4160v, 3Ph, 3 wire distribution system, in loop-feed configuration with 500 A main panel. 480/277v, 3Ph, four-wire for large HVAC motors. Two 208/120v dist panels on each floor. 150kw emergency generator for exit signs, emergency egress lighting and fire alarm.

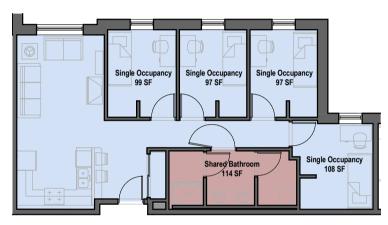

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

Abatement and demo bids, let separately, were \$85,305 and \$138,600. A heat recovery system was included in the project for \$95,000. Using DFD review criteria, the payback was projected at 6.0 years. A 1,000 gpm fire pump with 88 psi boost was provided. A pressure booster was required for plumbing. Technology systems include voice, data, cable television, telecommunications grounding and access control on exterior doors. One telecom room is located on basement level and first floor and two telecom rooms per floor on second, third, fourth and fifth floors.

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

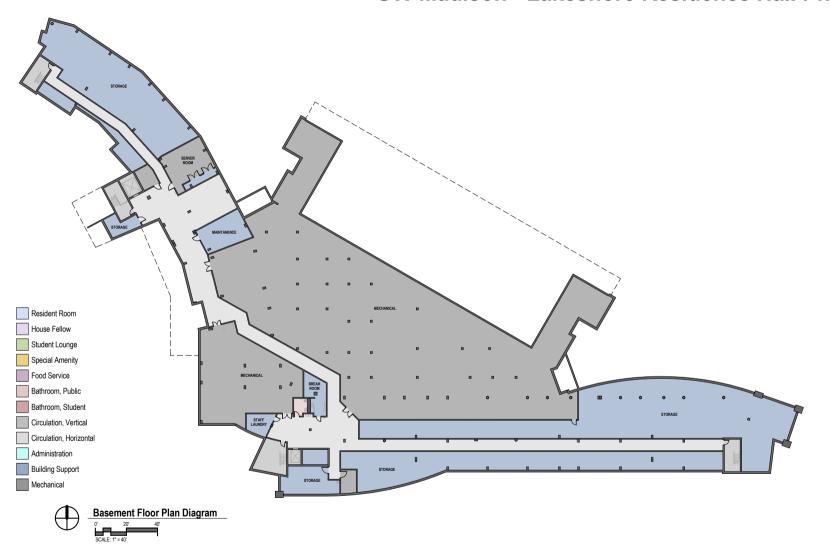

Foundations are conventional spread footings for both walls and columns. The superstructure is a post-tensioned concrete moment frame.

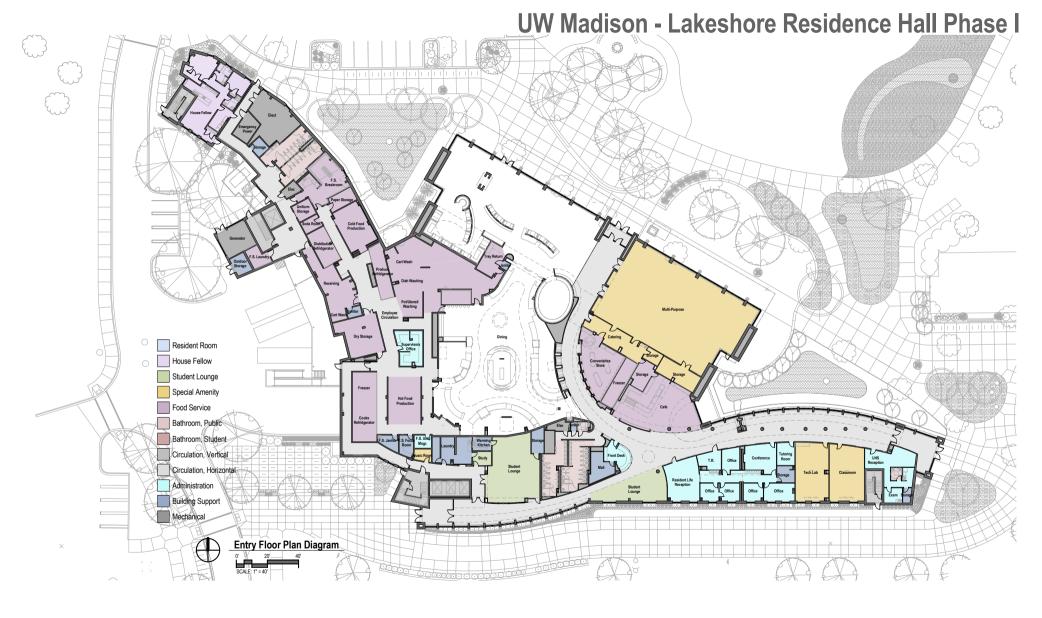

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Campus steam and chilled water for heating/cooling. 2 energy recovery units and 3 air handling units. Four pipe fan coil to condition each resident room with operable windows for ventilation. Steam for domestic hot water along with solar. Duplex water softener for domestic hot water. Building is served from 13,800 V campus loop with a 2500 A main panel. Emergency power is provided by a 350 kW generator.

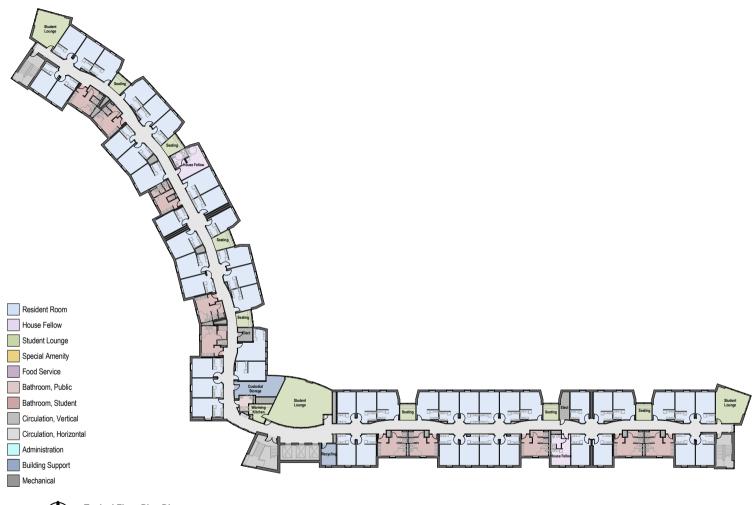

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

150 hp, 1250 gpm fire pump. Wood ceiling with fp above and below in dining area. 48 panel solar domestic water system. Kitchen and associated equipment. Technology systems include voice, data, cable television, telecommunications grounding, overhead paging, area of rescue assistance system, audio video systems, digital signage, dining menu board system, CCTV camera system and access control. One telecom room is located on basement level and first floor and two telecom rooms are located on second and fourth floors.

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 1.4%; Basement Alt/Storage, 2.6%; Circulation, 19.1%; Mechanical, 6.4%; Resident Suites, 43.6%; Special Amenity, 3.4%; Lounges, 7.3%; Jnassigned/other, 16.2%: The portion of this project analyzed is the residence hall (project also included a significant remodeling of adjacent Holt Commons).

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

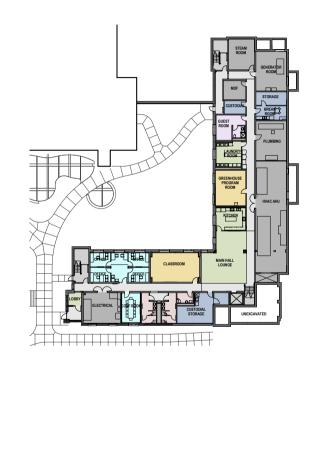

Superstructure is cast in place concrete foundations with normal spread footings, precast plank bearing on CMU. Interior partitions are painted CMU. Corridors receive a skim coat of plaster. Exterior walls are brick and manufactured stone with CMU backup and a typical DFD grade rain screen assembly. Roof is a fully adhered black EPDM membrane on tapered polyiso insulation. Windows are DFD grade single hung

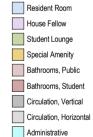

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

The building is supplied high-pressure steam and chilled water from the Campus system. Student room are heated/cooled by a 4-pipe fan coil units with operable windows for natural ventilation. Total energy recovery wheel reduces total building energy usage. 13.5 KV feeder loop off the campus system. Separate panel boards are provided serving lighting, plug loads, and HVAC loads so each could be metered separately on each floor. Duplex water softener for domestic hot water. Building is served from 13,800 V campus loop with a 800 A main panel. Emergency power is provided by a 150 kW generator.

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

This project features a working greenhouse on a portion of it's top floor, for use as a laboratory for the living/learning community that resides in this residence hall. Technology systems include voice, data, cable television, telecommunications grounding, overhead paging, audio video systems, digital signage, CCTV camera system and access control. One telecom room is located on basement level, second and fourth floors.

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 1.5%; Basement Alt/Storage, 2.6%; Circulation, 19.2%; Mechanical, 3.4%; Resident Suites, 47.6%; Special Amenity, 4.1%; Lounges, 5.1%; Unassigned/other, 16.4%

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

Substructure is conventional shallow concrete foundations. Superstructure is a 2-way concrete flat slab supported on concrete columns. Roof system is a 2way concrete flat slab supported on concrete columns. Lateral system consists of various concrete shear walls.

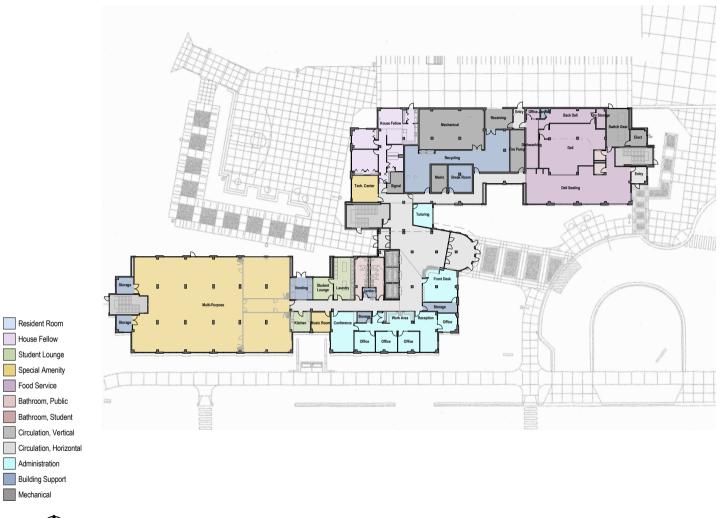

CIVIL: Civil work included demolition, grading, erosion control concrete paving, curb and gutter, sanitary, water, storm sewer, steam and chilled water.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Building is served from 13,800 V campus loop with a 2000 A main panel. Emergency power is provided by two tranSFer switches that are connected to a generator in the adjacent office building. Campus steam and chilled water for heating/cooling. 1 air handling units. Four pipe fan coil to condition each resident room with ventilation air form operable windows. Plumbing system includes water softener, booster pumps, and 2 steam water heaters.

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

Technology systems include voice, data, cable television, telecommunications grounding, CCTV cameras and access control on exterior doors. One telecom room is located on basement level, first, second, third, fourth, fifth and sixth floors.

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 1.2%; Basement Alt/Storage, 7.9%; Circulation, 19.4%; Mechanical, 3%; Resident Suites, 45.4%; Special Amenity, 4.9%; Lounges, 5.8%; Unassigned/other, 12.5%

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

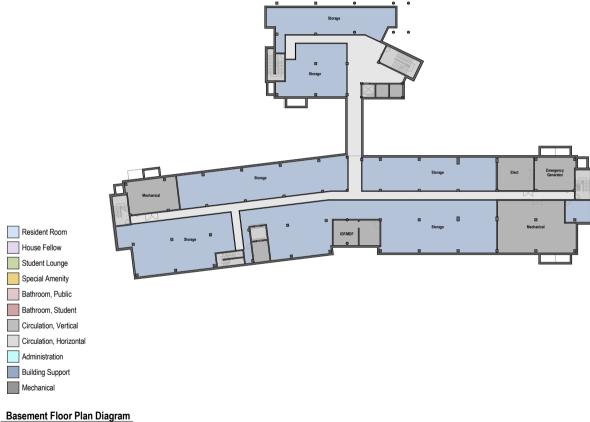

Poured concrete footings, foundations, columns, basement and first floor slabs; post-tensioned floor and roof slabs; precast concrete wall panels; aluminum windows, storefront and curtain wall; EPDM roof. CIVIL: Civil work included demolition, grading, erosion control, concrete paving, asphalt paving, traditional and mountable curb and gutter, bike parking, sanitary, water, steam, chilled water, storm sewer. Sanitary and water services were provided from adjacent

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Campus steam and chilled water are used to heat/cool building. 4-pipe FCUs in resident rooms with operable windows; 3 VAV AHUs system for common spaces;3 MAUs for ventilation. Plumbing system included a duplex presssure booster, water softeners, 2 steam water heaters. Building is served from 13,800 V ampus loop with a 1600 A main panel. Emergency power is provided by a 250 kW generator. Building is served by 750 KVA tranSFormer; 408-208/120 distribution; 24-hour 277/480v emergency generator; fiber/copper data and video; copper voice; card access, CCTV and paging systems.

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

Rainwater infiltration courtyard provided to minimize storm run-off. Dry pipe fire protection system in parking area. A 1,000 gpm fire pump with 60 psi boost was provided. Technology systems include voice, data, cable television, telecommunications grounding, audio video rough-in with cabling, overhead paging, CCTV cameras covering entrances and access control on exterior doors. One telecom room is located on basement level and two telecom rooms per floor on econd, third, fourth, fifth and sixth floors.

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

CIVIL: Civil work included demolition, grading, erosion control concrete paving, curb and gutter, bike parking, sanitary, water, storm sewer, steam and chilled

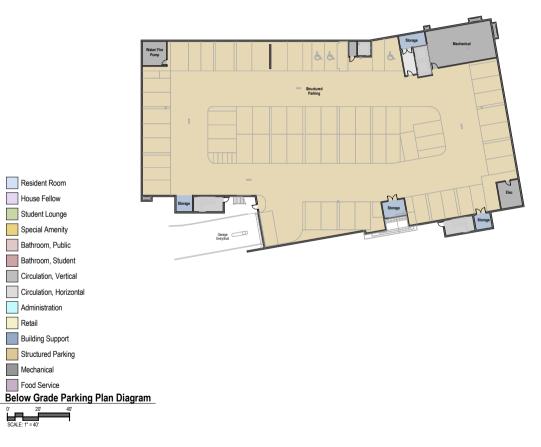

water. Stormwater management was achieved through biofiltration basins on the project.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Campus chilled water and steam used for heating and cooling. Four pipe fan coils to condition resident rooms. One energy recovery unit for ventilation and exhaust and one air handling unit to server common areas on first floor. Operable windows for resident rooms. Duplex water softener used for softening domsetic hot water. Fully sprinkled building with fire pump. Building is served from 4160 V campus loop with a 1600 A main panel. Emergency power is provided by a 40 kW generator.

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

8 solar planels for domestic water heating with capacity for several future panels, 2 backup gas fired domestic water heaters. 100 hp fire pump with 1000 gpm of flow. Technology systems include data, cable television, telecommunications grounding, area of rescue assistance system, audio video rough-in, doorbell system, CCTV camera rough-in including cabling, access control on interior and exterior doors. Two telecom rooms are located on first floor and one telecom room on third floor.

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

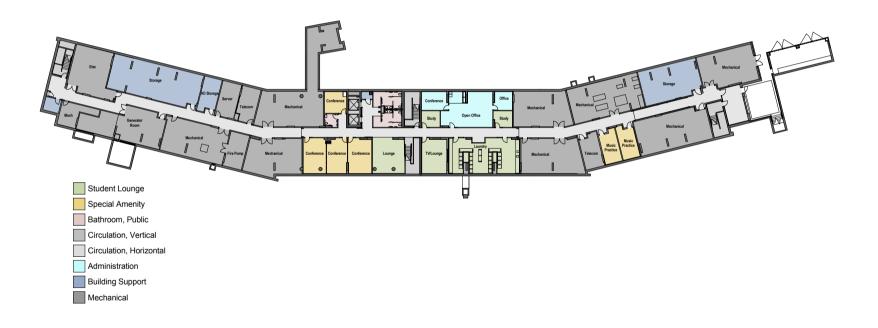

CIVIL: Civil work included demolition, grading, erosion control concrete paving, asphalt paving, traditional and permeable pavers, sand volleyball court, dumpster enclosure, traditional curb and gutter, sanitary, water, storm sewer, geothermal well system, steam and chilled water. Stormwater management was achieved through a biofiltration basin and rain garden.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Campus steam and chilled water for heating/cooling. 2 energy recovery units and 2 air handling units. Four pipe fan coil to condition each resident room with ventilation air form ERUs. Plumbing system includes pressure boosters, water softener, 2 Steam water heaters for domestic hot water along with geothermal. Building is served from **** V campus loop with a **** A main panel. Emergency power is provided by a *** kW generator.

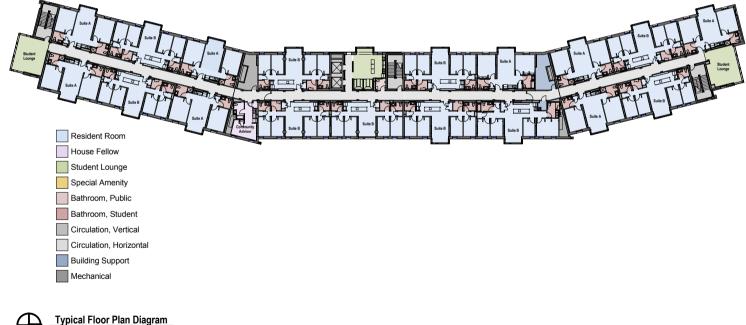

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

Project demolished three res halls to make way for new one. 500 gpm fire pump along with Jockey pump. 375 LB main and rerserve FE-25 storage cylinders filled with amount of agent required to protect the Server room and Telecom area. Kitchen and associated equipment

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

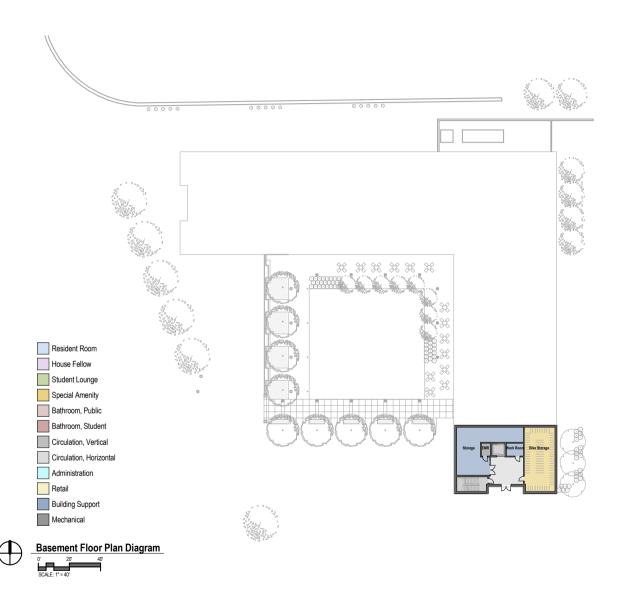

Civil work included demolition, grading, erosion control, concrete paving, pervious crushed stone walkway, sanitary, water, and storm sewer.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

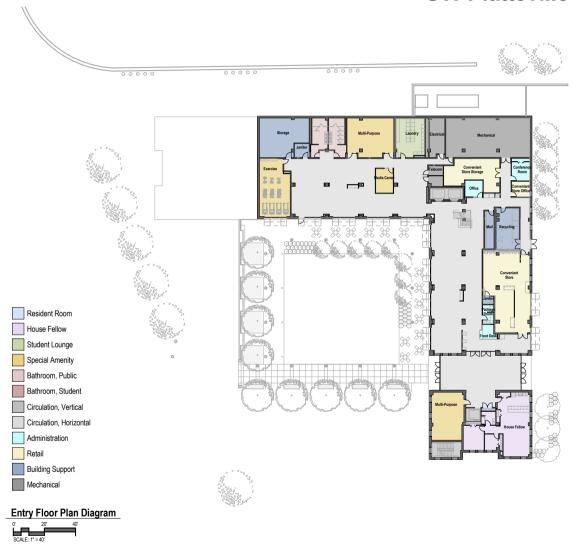

Building is served from by an Alliant Energies utility transFormer with a 2000 A main panel. Emergency power is provided by a 150 kW generator. 2 high efficiency non condensing boiler for heating water and 1 air cooled chiller for the chilled water system. 2 direct gas fired MAU for the Laundry and Kitchen area and 1 AHU for Ground floor service. 2 pipe fan coil units for resident rooms. Water softener for the potable water and gas fired domestic water heater.

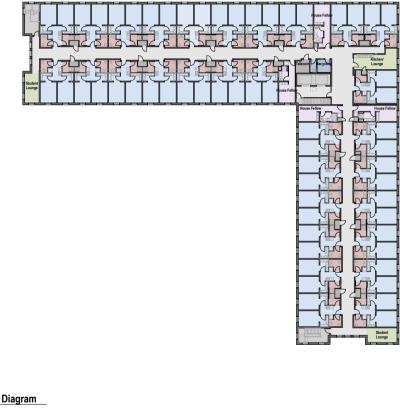

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

300 gpm@70 psi fire pump. Technology systems include voice, data, cable television, CCTV and access control. One telecom room is located on first, second, third, fourth, fifth and sixth floors.

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.): Superstructure: Precast concrete planks

with concrete topping on load bearing masonry walls and steel beams. Limited steel columns. Exterior Walls: Load bearing and non-load bearing cavity walls with concrete masonry backup clad with brick, stone and metal wall panel.

CIVIL: Civil work included demolition, grading, erosion control concrete paving, curb and gutter, bike parking, sanitary, water, storm sewer, steam and chilled water. Stormwater management was achieved through biofiltration basins on the project.

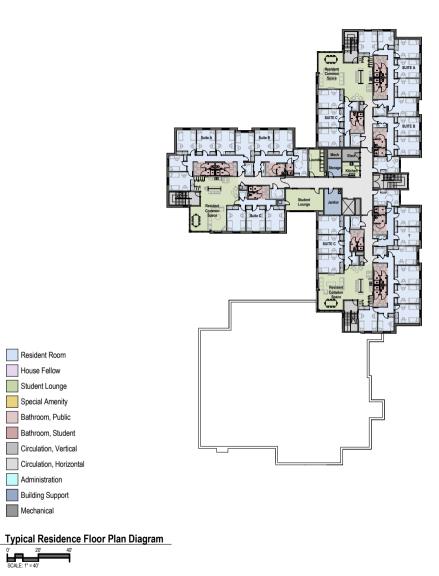

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.): Campus chilled water and steam used for heating and cooling. Four pipe fan coils to condition resident rooms. One energy recovery unit for ventilation and exhaust and one air handling unit to server common areas on first floor. Operable windows for resident rooms. Duplex water softener used for softening domsetic hot water. Fully sprinkled building with fire pump. Building is served from 4160 V campus loop with a 1600 A main panel. Emergency power is provided by a 40 kW generator. Special Features: (Brief description of special design, equipment, or Retail features of significant cost.): The project is designed to obtain LEED certification and allow for addition of renewable energy technologies in the future. The project also includes a 120-stall paking lot expansion, a road extension to link the existing road to other interior circulation, retention pond, bio-swales, rain gardens, boardwalk, and related landscaping and

8 solar planels for domestic water heating with capacity for several future panels, 2 backup gas fired domestic water heaters. 100 hp fire pump with 1000 gpm of flow. Technology systems include data, cable television, telecommunications grounding, area of rescue assistance system, audio video rough-in, doorbell system, CCTV camera rough-in including cabling, access control on interior and exterior doors. Two telecom rooms are located on first floor and one telecom room on third floor.

Total Construction Cost

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

Structure system for 5-story tower is reinforced masonry bearing wall with precast plank floor. Structural precast beams & columns were used for the west wing to increase open floor space. Foundation system for both are conventional spread & strip footings with slab-on-grade. Exterior veneer is decorative CMU over CMU back-up; anodized aluminum metal panels over cold formed metal stud framing; Aluminum operable windows, storefront and curtain wall.Fully adhered EPDM. CIVIL: Civil work included demolition, grading, erosion control concrete paving, exposed aggregate concrete paving, reinforced grass mergency route, fence and seat walls, curb and gutter, bike parking, sanitary, water, storm sewer, steam and chilled water. Stormwater management was achieved through aggregate ribbons, runnels and infiltration around the project.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

ampus steam and chilled water for heating/cooling. 2 energy recovery units and 1 air handling units. Four pipe fan coil to condition each resident room with ventilation air form ERUs. Plumbing system includes water softeners, booster pump, and 2 steam domestic hot water heaters along with solar heating . Building is served from 12,470 V campus loop with a 2000 A main panel. Emergency power is provided by a 150 kW generator.

pecial Features: (Brief description of special design, equipment, or Retail features of significant cost.)

Storm water management-control flow system. Site has a 'storm-water ribbon' (rain garden) diverts hundreds of rain water per year. Pressure booster for domestic water. 1500 gpm fire pump. Kitchen and associated equipment. 4'x10" Solar collectors, 6 arrays of 6 collectors for solar water heater. Technology systems include voice, data, cable television, telecommunications grounding, One telecom room is located on basement level, first and fourth floors.

Functional Description: (List primary functional uses & percent of assigned area for each.)

Administration, 0.5%; Basement Alt/Storage, 7.0%; Circulation, 17.3%; Mechanical, 6.8%; Resident Suites, 56.5%; Special Amenity, 1.1%; Lounges, 2.0%; Unassigned/other, 8,9%

Architectural Specification: (Brief description of foundation, superstructure, exterior walls & roofing.)

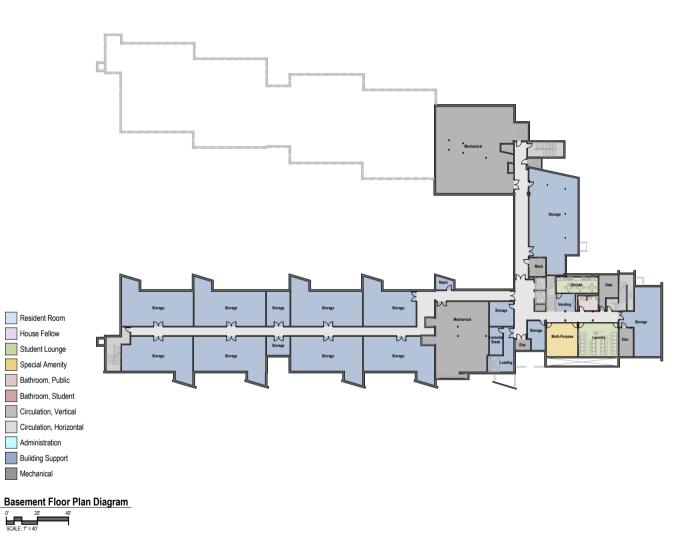

Pad and strip footings, concrete foundation, precast plank and bearing CMU structure with small area steel framed. Masonry veneer cavity wall; some architectural precast wall panels. Ballasted EPDM roof. Hydraulic passenger elevator and recrirocating conveyor. CIVIL: Civil work included demolition, grading and retaining walls, erosion control, concrete paving, asphalt paving, traditional curb and gutter, sand volleyball court, sanitary, water, steam, chilled water, storm sewer. Stormwater discharges to municipal storm sewer in Farwell Street. Sanitary and water services were provided from adjacent public right of way.

Mechanical & Electrical Specification: (Brief description of mechanical & electrical systems.)

Campus steam and chilled water are used to heat and cool building. Four pipe fan coils are used in the resident rooms. The building has 2 energy recovery units for ventilation and 2 air handlers to serve common areas. Ventilation was provided to each room by ducting to the return of the fan coil unit. Steam domestic water heaters and two small gas fired water heaters. Duplex water softeners for domestic hot water. Building is served from 4160 V campus loop with a 1200 A main panel. Emergency power is provided by a 200 kW generator.

Special Features: (Brief description of special design, equipment, or Retail features of significant cost.)

LEED-Gold. 30 hp, 750 gpm fire pump. Triplex booster pump package, 7.5 hp each. Technology systems include data, cable television, telecommunications grounding, area of rescue assistance system, audio video rough-in, doorbell system, CCTV camera rough-in including cabling, access control on exterior doors and ADA rooms, access control rough-in on all other suite doors and telecom rooms. Individual suite metering of electrical loads

Definitions: Housing Type

Type 1 Double occupancy rooms with common bathrooms (gang) on each floor. This is the most common type of housing in the system, built primarily in the 1950's and 1960's

Type 2 Double occupancy rooms, with shared bathrooms that range from four, eight to twelve students sharing a common bathrooms are internal between rooms or external accessible from the hallway. External bathrooms are locked and only accessible

by the students within the area. Examples include: UW-Parkside, Ranger Hall (1997); UW-Madison, Park Street (2006); UW-Madison, Dayton Street (2007)

This style of housing provides small single occupancy rooms with shared bathroom, living area and kitchen or kitcenette. There are often called 'suite' or 'apartment style units. This is the most common type of housing built in the last five years. Examples include: UW-Eau Claire, Chancellors Hall (2000); UW-Milwaukee, Sandburg Hall (2002); UW-Stout (2005); UW-Stout (2005); UW-River Falls (2005); UW-La Crosse (2006); UW-GreenBay (2002, 2003, 2004)

| ZUUS; UW-La Crosse (ZUUS); UW-Greenbay (ZUUZ, ZUUS, ZUUS)
| Type 4 | Six sylve of housing is primarily for practicates or upper class students. The housing can range from studio, one or two bedroom apartments where either a single person or whole family can live.

| Type 4 | Six smples include: UW-Madison, Eagle Heights; UW-Milwaukee, Kenilworth (Z008) | Residence Hall Six of the following reason within the building: Resident Bathrooms, Public Bathrooms, P

Section 2: Planning Document

The following chart provides a simple comparison of the sizes and costs of 5 representative housing projects.

August 29, 2012	12A3G: UW Sy	12A3G: UW System Housing Study - Executive Comparison of Selected Residence Halls												
Residence Hall	Date Decision Made to Build		Agency & Method Used	Date of Occupancy	Gross Square Feet	Overall Project Cost	Construction Cost	Const Cost per Square Foot	Const cost per Bed	Cost per sf 2013	Cost per bed 2013		Average Unit Size	Bed:Bath Ratio
UW Platteville - Rountree Commons	Dec-09	Jan-11	Foundation Led	Aug-12	153,068	\$18,615,629	\$16,422,312	\$107	\$26,402	\$108	\$26,666	622	600	4 to 1

UW Platteville - Southwest Hall	May-04	Mar-05	DB-LP	Aug-06	154,157	\$21,100,000	\$17,500,000	\$114	\$45,812	\$138	\$55,707	382	1,110	4 to 1
Viterbo University Clare Apartments	Mar-10	May-11	Negotiated GMP	Jul-12	74,972	\$8,056,895	\$7,643,895	\$102	\$64,779	\$103	\$65,427	118	1,065	2 to 1

Space planning commentary:

Demand Analysis: It is strongly recommended that each campus conduct a thorough and accurate assessment of their current housing stock compared to future housing demand in order to identify demand, options, construction costs, and operational costs. This assessment should include an analysis to determine whether or not to remodel, replace, add new, or some combination of these options to address housing needs.

Dwelling Unit Configuration: It is recommended that User Agencies review their current mix of housing types, review their current and future demand, and then focus their planning efforts on a unit type that meets demand. Unit types and support space types recommended for freshmen, sophomores, and upper division students all differ. Additionally, the choice of size and location of lounge spaces and other support spaces will have an impact on the student experience in the hall, but also the first cost and operating cost of the hall, and should be considered carefully. The trends over the past 7 years show a user agency preference to have suite style units for freshmen and sophomores with a two occupant bedroom and 4 to 5 occupants sharing a bathroom with in the suite, and apartment style units for upper division students. Apartment style units constructed at UW campuses over the past 7 years are almost universally configured as 4 single occupant bedrooms, one bathroom (split into separate rooms for toilet, shower and lavatories), a fully functional kitchen, and a living room.

Bathroom configuration: All but one UW institution are building residence halls that have bathrooms accessed from within the suites. Bathrooms designed to have separate enclosure of showers, toilets and lavatories have an efficiency that minimizes the quantity of fixtures while maximizing the ability of occupants to use them concurrently with privacy. This applies to both suite style units and apartment style units. Another bathroom planning issue that is commonly debated is how many bathrooms to provide for a 4 bedroom apartment style unit. Two

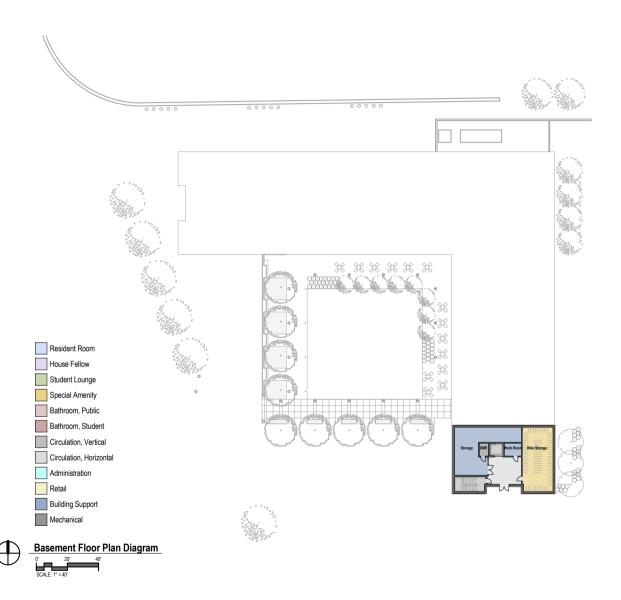

apartment style units designed for UW institutions have 2 bathrooms, and five have "one" bathroom with fixtures in separate enclosures. Privately developed projects are providing up to 4 bathrooms in a 4 bedroom unit, but rent received is commensurate with this added feature.

Lounge Configuration: Lounge space provided in the suite style buildings is generally provided in proximity to a "house" of 30 to 40 students, with the intent of having it be a gathering space outside of the suite where students can form a sense of community, and provide intra-house academic and social support. In the apartment style units, lounge space is far smaller, and is generally provided on the first floor, where it is used by all residents, with no sub-group of a "house" community, since upper division students are typically interested in more independence, and need less direct social and academic support.

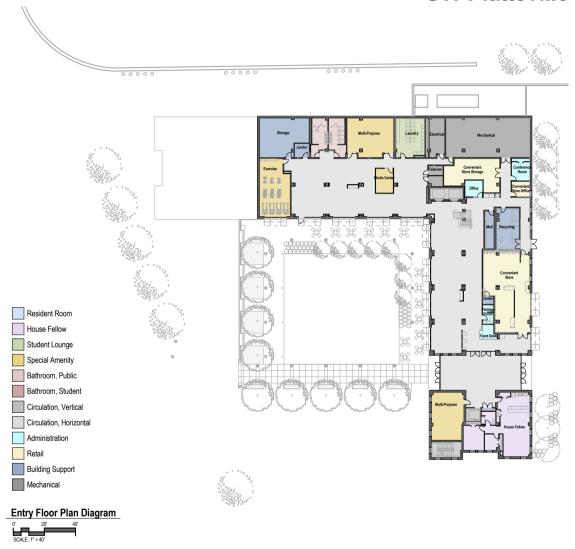

Other spaces included in the analyzed Residence Halls are the following. User Agencies should thoroughly study campus needs and student demands, and carefully consider which of these support spaces are needed for their particular campus. These spaces have a large impact on first cost, operational cost and functionality:

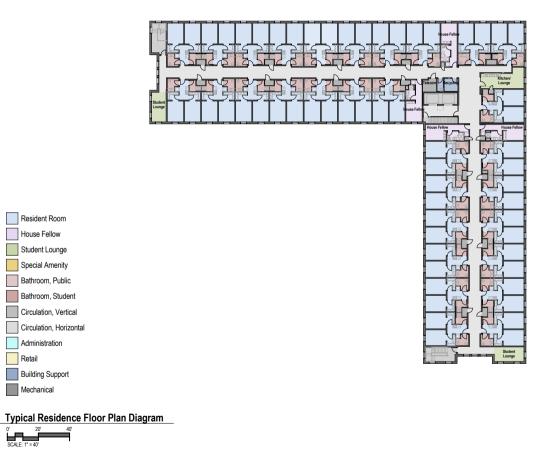

- 1. Residence Hall Director Apartments
- 2. Staff Offices
- 3. Laundries
- 4. Entry lobbies
- 5. Service areas, storage, and loading docks
- 6 Full basements
- 7. Dining Facilities
- 8. Academic classrooms
- 9. Computer labs
- 10. Study rooms
- 11. Large meeting spaces capable of accommodating all hall meetings
- 12. Enclosed bike parking
- 13. Enclosed scooter parking
- 14. Enclosed automobile parking

Construction and MEP Systems Planning

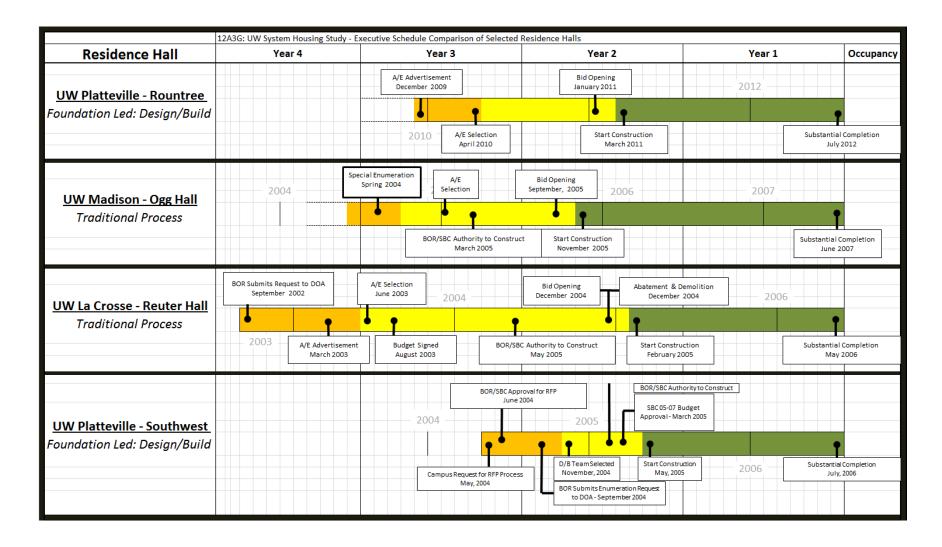

The following matrix provides a simplified overview of recommended construction standards, life spans, efficiencies and costs, and compares them to other construction standards, life spans, efficiencies and costs. Costs and lifespans are provided to illustrate order of magnitude differences for planning purposes. Actual costs and lifespans will vary based on actual elements included in projects. Recommended systems are rooted in the philosophy that you should prioritize funds for quality systems in those areas that are hardest to fix and/or provide the best payback on efficiency.

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
configuration	Owner Choice based on market demand and exit strategy, typically apartment style. Common & Support areas provided at minimum amount demanded by market. Indoor parking provided	User Agency Choice based on market demand. Common & Support areas provided as determined to be necessary by Owner/User Agency	User Agency Choice based on market demand. Common & Support areas provided as determined to be necessary by User Agency	Add large group gathering spaces, full basements, classrooms, dining facilities, and/or indoor parking
superstructure	Can range from wood frame to metal studs, depending on size & height of building	Metal Stud, Steel, CMU or concrete	CMU or Concrete	Concrete column and mild steel flat plate, configured to allow for complete interior reconfiguration in the distant future
floor to floor heights, ceiling heights	10' floor to floor, 8' high ceilings in corridors, bathrooms and kitchens, 9' high ceilings in bedrooms and living rooms	10' floor to floor, 8' high ceilings in corridors, bathrooms and kitchens, 9' high ceilings in bedrooms and living rooms	12'-8" floor to floor, 9' high ceilings in corridors and bathrooms, 11' high ceilings in kitchens, bedrooms and living rooms	Higher floor to floor between first and second floor to accommodate higher ceilings in large meeting rooms
envelope	Can range from wood siding to brick. Exterior walls insulated with batt insulation. Minimal window size and quality. Pitched roof with asphalt shingles	Brick, metal panel. Exterior wall with rain screen air space, rigid and/or sprayed closed cell foam insulation. Larger window sizes to increase views and daylight. Medium range window quality and performance. Ballasted EPDM roofing	Brick, metal panel. Exterior wall with rain screen air space, rigid and/or sprayed closed cell foam insulation. Larger window sizes to increase views and daylight. High quality and performance windows. 30 year EDPM adhered roofing	Add stone, window shading devices, green roof, etc.
vertical circulation	One elevator, two exit stairs	One elevator, two exit stairs	One elevator, two exit stairs	Add another elevator, add central communicating stair
interior construction	Gyp board on wood or metal studs. Gyp board ceilings.	Gyp board on metal studs. Gyp board ceilings.	CMU in common areas, gyp board on metal studs inside dwelling units. Painted concrete ceilings in bedrooms and living rooms, moisture resistant gyp board ceilings in bathrooms and kitchens, ACT in corridors	Add skim coat plaster to CMU partitions, in common areas and/or inside dwelling units

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
interior finishes	Painted walls and ceilings, carpet	Painted walls and ceilings, carpet	Painted walls and ceilings, carpet	Terrazzo or stone flooring in main
	in corridors, bedrooms, and living	in corridors, bedrooms, and living	in corridors, bedrooms, and living	lobbies, wood look vinyl plank

Typical cost per bed 2012	\$68,500	\$55,190	\$63,275	
Anecdotal Lifespan Assumption	20 - 25	20 - 30	40 +	

Schedule Planning

The following matrix compares typical State of Wisconsin project tasks and timelines to tasks and timelines for other project delivery methods. Tasks and timelines are provided to illustrate order of magnitude differences between project delivery method. Actual project timeline will vary by user Agency and specific approach and task.

Section 3: Project Construction System and MEP System Component Planning Checklist

The following matrix provides a simplified narrative of options for construction components and mechanical, electrical, plumbing fire protection and information technology systems. This narrative is intended to provide a simplified overview of systems that are being constructed in the private sector for "basic code compliant" buildings, up to buildings compliant with DFD and UW System guidelines. In addition to this, there is a section that notes project enhancements that agencies could consider during their project scope definition process. Information provided herein is intended to encourage discussion about the functional necessity, first cost and operations cost of a variety of components that a user agency could include in a building. Each building will be different as it addresses the specific needs of the user agency, and the synergistic interrelationship of all of the components should also be considered along with the performance of the individual components.

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
General Parameters				
Functional Configuration	Owner Choice based on market demand and exit strategy, typically apartment style. Common & Support areas provided at minimum amount demanded by market. Indoor parking provided	necessary by Owner/User Agency	User Agency Choice based on market demand. Common & Support areas provided as determined to be necessary by User Agency	Add large group gathering spaces, full basements, classrooms, dining facilities, and/or indoor parking
Project Delivery	Owner choice	User Agency and UW System Driven	User Agency, UW System, DSF, BOR, SBC Driven.	
Number of Approving Entities	Owner, Zoning, Building Code	User Agency, Zoning, Building Code. System, BOR and SBC involvement if State Bonding or buy back is requested.	User Agency, Zoning, Building Code, DSF, UW System, BOR, SBC, EIS	
Construction Delivery	Negotiated GMP, one general contractor, MEP Delivered design/build, early start packages	Negotiated, hard bid or GMP. Single Prime. MEP could be delivered design/build. Could have early start packages	Hard Bid. Multiple Prime Contractors	CM on board at beginning of project for cost & constructability input, all subcontracts hard bid, early start packages possible
Financing	Private	Private or Public Bonds	Public Bonds	
Debt Retirement/Depreciation	20 years	30 years	30 years	
Sustainability	Driven by Cost Savings, Market Perception	Driven by Parameters Determined to be appropriate by User Agency	Driven by DSF Sustainability Guidelines and Governor's Energy Conservation Policy	LEED or Green Globe Certified
Accessibility	ADAAG, ANSI, IBC	ADAAG, ANSI, IBC	ADAAG, ANSI, IBC, DSF Guidelines	Universal Design
Commissioning	Not done	User Agency Choice	DSF Guidelines	DSF Enhanced Commissioning
Daylighting	Not Done	User Agency Choice	DSF Guidelines	LEED or Green Globe Certified

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
Site				
Land Purchase	Land Purchased at Market Rate	Land Purchased at Market Rate	Existing Campus Land Utilized	
Zoning Compliance	Compliance with local zoning	Compliance with local zoning	Compliance with local zoning not	
	required	required	required but usually complied with	
Demolition	Will leave below grade elements in	Might leave below grade elements in	Won't leave below grade elements in	Don't leave below grade elements in
	place	place	place	place
Environmental Cleanup	EPA Compliant, encapsulation	EPA Compliant, encapsulation	EPA Compliant, complete remediation	
Utility Extensions	Minimum required for project	Minimum required for project	DSF compliant higher quality	
	functionality. Connection to public	functionality. Connection to public	materials and installation.	
	utilities	utilities	Connection to campus and public utilities	
Stormwater Management	Minimum required by local code, if	As required by local code	As required by User Agency and DSF	Rain Gardens, Green Roofs,
	any		Guidelines	Detention, and/or Retention
Irrigation	not provided	User Agency Choice	DSF Guidelines limit irrigation to playing fields	Full irrigation of all landscaping
Vehicular Parking	Provided as required by zoning and	Provided as required by zoning and	Usually consolidated with other	Provide surface or structured parking
_	market demand	market demand	parking on campus	for residents
Bicycle Parking	Provided as required by zoning and market demand	Provided as required by zoning and market demand	Usually provided per campus interpretation of occupant demand	Indoor bike parking
Paving	Asphalt & concrete curb	Asphalt & concrete curb	Asphalt or concrete, concrete curb & gutter	Pervious paving
Landscaping	Seeded grass turf, minimal ground	Seeded grass turf, minimal ground	Seeded grass turf & ground plantings	Sodded turf & ground plantings
	plantings	plantings	consistent with campus standards	consistent with campus standards, plus outdoor gathering spaces
Recreational Facilities	not provided	Might be provided	As determined to be needed by user agency	
Site Lighting	minimum industry standard	provided to address safety concerns		provided to address safety concerns, high efficiency LED fixtures, dark sky compliant
Emergency Phones	not provided	provided per campus standards	provided per campus standards	Provided

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
Superstructure				
Footings	Reinforced concrete, in type as	Reinforced concrete, in type as	Reinforced concrete, in type as	Design for future expansion
	required for soil conditions	required for soil conditions	required for soil conditions	
Foundations	CMU	Reinforced Concrete	Reinforced Concrete	Design for future expansion
Above Grade Structural System	Wood or Metal Stud, bearing walls	Metal Stud bearing walls	CMU bearing walls with precast	Mild Steel Reinforced Concrete to
			plank, Mild Steel Reinforced	provide flexibility in future

Exterior Envelope				
Wall System	Batt insulated stud cavity, gypsum	Foam insulated stud cavity, gypsum	CMU, rigid insulation, liquid applied	
	sheathing, fabric air barrier	sheathing, liquid applied air barrier	air barrier (or insulated precast panel	
			[caution regarding long term re-caulk	
			cost])	
Exterior Cladding	Wood, vinyl, CMU, concrete brick, or	concrete brick or brick, metal wall	Brick, stone, architectural precast, or	brick and stone
	brick	panel	metal wall panel	
Windows & Doors	clad wood, thermal pane	prefinished aluminum, thermal pane	thermally broken high performance	
			prefinished aluminum, tinted,	
			insulated, low E glass	
Roofing	Shingles or fully adhered EPDM	Fully adhered EPDM	Fully adhered EPDM	Hot Mopped Built Up Roof; slate tile;
				clay tile; full depth green roof (not
				trays)
Thermal Performance	code compliant	code compliant	10% better than code per Governor's	LEED or Green Globe Certified
			Energy Conservation Policy	

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
HVAC	·			
Residence Room Toilet Exhaust	Code compliant intermittent bathroom exhaust	Code compliant intermittent bathroom exhaust	Code compliant intermittent bathroom exhaust for individual bathrooms and continuous bathroom exhaust for multiple fixture bathrooms	Continuous bathroom exhaust
Residence Room Ventilation	Natural ventilation with use of operable windows for sleeping room and residence units.	Natural ventilation with use of operable windows for sleeping rooms and residence units.	Natural ventilation with use of operable windows for sleeping rooms and mechanical ventilation to corridor	Mechanical ventilation ducted to residence room.
Residence Room Conditioning	PTAC	2-pipe change over system	4-pipe fan coil unit or heat pump in room or ducted to room.	Variable speed 4-pipe fan coil unit or heat pump with ducted air to room
General Space Conditioning	Roof-top units or fan coil units with ducted ventilation air to units	Variable air volume (VAV) air handling unit with ducted ventilation air to unit	VAV air handling unit with ducted ventilation air to unit and CO2 ventilation control for spaces with variable occupancy.	VAV AHU with dedicated outside air system (DOAS) for ventilation and CO2 ventilation control for spaces with variable occupancy.
Storage Room Conditioning	No conditioning	Heating only	Heating and dehumidification for lower level storage	Heating, ventilating, and dehumidification for lower level storage
Telecommunications/Security Room Conditioning	Units may need to operate 24hr/day. Consider stand alone unit. PTAC	PTAC on Emergency Power	Computer room unit.	Computer room unit on emergency power.
Kitchenettes	Recirculating hood	Recirculating hood	Ducted hood with recirculating hood used only in limited applications	Ducted hood
Stand Alone Heating System	Standard efficiency hot water boilers	High efficiency non-condensing hot water boilers	High efficiency non-condensing hot water boilers	High efficiency condensing hot water boilers with year round low heating water temperatures to gain maximum efficiency
Stand Alone Cooling System	Direct expansion (D/X)	Air cooled chiller	Water cooled or Air-cooled chiller	Variable primary flow water cooled chiller
Heat Pump - Stand Alone Heating/Cooling System	Boiler/cooling tower heat pump loop serving individual heat pumps	Ground source heat pump loop with supplemental boiler heating serving individual heat pumps	Ground source heat pump loop with supplemental boiler heating serving individual heat pumps	Ground source heat pump loop with central geothermal unit creating chilled water and heating water
Temperature Controls	Stand alone controls for everything	Stand alone controls for residence rooms and network controls for major equipment such as AHU, ERU, heating system, cooling system.	Network controls for major equipment and individual units serving residence rooms.	Network controls for major equipment, fan coils, energy metering of electric, gas, water, steam, chilled water, etc.

Design Component	Basic Code Compliant	Medium Quality	Recommended Quality	Enhanced Option
Energy Recovery Unit	No energy recovery, unless required	Energy recovery with heating coil	Energy recovery with heating coil	Energy recovery with heating coil
	by code		sized based on energy wheel failure	sized based on energy recovery
				failure
Air Handling Unit Filtration	1" Panel filter	MERV 7 - 2" pleated filter	MERV 11 bag or cartridge type filter	MERV 13 bag or cartridge type filter
1000/ Nov. Microbial Contribution	Chandral dariable blade intella	Character de la desirable de la desirable	with MERV 7 pre-filters	with MERV 7 pre-filters
100% Non Mixed Air Outside Air Intake Louvers	Standard drainable blade intake louvers sized at 700-900 fpm free	Standard drainable blade intake louvers sized at 500-600 fpm free	Standard, drainable style louver sized at 350 fpm free area with ductwork	at 350 fpm free area with ductwork
intake Louvers	area	area	layout to minimize snow intake	layout to minimize snow intake
